

ESET REMOTE ADMINISTRATOR

Datasheet

www.eset.com

Manage all servers, endpoints, and even smartphones and virtual machines from a single console. Support for IPv6 infrastructure makes management of network security even easier. The comprehensive console interface lets you view all security-related events, including logs from antivirus, firewall, web control, device control and others.

ESET Remote Administrator - Console

System Requirements:

Microsoft Windows® 7, Vista, XP,
Windows Server 2008 R2, 2008, 2003, 2000

ESET Remote Administrator - Server

System Requirements:

Microsoft Windows® 7, Vista, XP,
Windows Server 2008 R2, 2008, 2003, 2000

Database Support:

MySQL 5.0+, ORACLE 9i+, MSSQL 2005+

Processor Architecture:

Intel®/AMD® x86/x64

- NEW Real-time Web Dashboard**

Access web-based dashboard from anywhere for quick at-a-glance security status using live streaming of data. Customize the information displayed on the dashboard to get the most up-to-date information on the security status from the server and clients.
- NEW Role-based Management**

Assign privileges to different remote administration users and delegate responsibilities accordingly. The built-in password strength checker and audit functionality ensure that administrator accounts are properly secured.
- Dynamic Client Groups**

Create dynamic and static client groups for easier policy enforcement and to address any pressing issues. Select from these parameters for groups: operating system, client name mask, IP mask, recent threat detected, and many more. Clients are moved automatically to the corresponding group if parameters change.
- Event Notifications**

Specify log and report parameters or choose from more than 50 templates. Have notification sent immediately or in batches based on custom threshold for security-related events.
- NEW Randomized Task Execution**

Minimizes AV storms on virtual endpoints and reduces resource contention on networked drives. Random tasks execution helps offset the effect of simultaneous system scans on the network performance.
- Local Update Server**

Have all clients update from a local mirror server and minimize Internet bandwidth usage. For your mobile workforce define policies to update from ESET online servers when outside of home network. The local update server supports secured (HTTPS) communication channel.
- NEW Update Rollback**

Revert virus signature and module updates to a known good state in case of encountering system incompatibilities. Opt to freeze updates temporarily or until manually changed.
- NEW Posponed updates**

Opt to download from 3 specialized update servers: pre-release (beta users), regular release (regular users) and postponed release (approx. 12 hours after regular release). Apply antivirus updates to non-critical systems first, followed by critical ones with the option of clearing the update cache.
- NEW Microsoft NAP Support**

Helps resolve compliance issues with company network access policy. You can set compliance requirements such as age of virus database, antivirus product version, protection status, availability of antivirus protection, as well as firewall status – and force database updates.
